Blog posts

Main content and links

Comments

Not quite certain this is what we're looking to achieve but I'm pretty happy with just the chicken scratch I came up with. I'll look at some other blog websites that already exist on the interwebs.

- For now I also think I can go ahead and start implementing what's up above and here it may be helpful for me to document or "think out loud" for how to implement some of these elements.
- Given just what is up above I'm not sure how much JavaScript will be required to get the project going. I've never hooked a database up to a website other than what I did in the reading assignments.
- Quite a bit of inspiration for this design came from Piazza, it may be helpful for me to look at how some of that was built.

UI:
Favicon:
- Not going to go through the effort of designing my own blog logo unless I think I can do something funny with MS Paint. I'll just put an image that makes sense here and the current plan is to link the home menu here as well.
Title:
- Got to come up with a creative title for the blog page and place it here (maybe make this a link to the home menu and consider removing the favicon since at least for now I'm planning on using the favicon as a home menu link too).

Other blog Channels:
- Here can be links to either some blog threads or multiple blog channels, maybe even a preview of what is in the blog (Almost like what you'd see on Piazza).

Blog post:
- This is the main content of the page and where the posts people share will be displayed. This will also be where information being pulled from the database will be displayed.
- I will consider adding more here if I can implement what I have pictured above.

Comments:
- I would like to have a response section for blog posts (kind of like Piazza or a forum where additional questions/comments can be shared and responded to as well.

Navigation menu:
- Unordered list of links stylized to look like buttons and run horizontally across the top of the page below both the favicon and the title.
